

23. 04. 2015

After 3D seismic data reprocessing carried out by your company our geoscientists were able to refine the geological structure of the target interval and to make informed economic decisions. The high quality of the final results was achieved through the building of the detailed VTI/TTI anisotropic velocity model and subsequent prestack depth migration on common reflection angles (CRAM). The project was completed on time and on high professional level. Looking forward for further cooperation.
